

Webinar: Certificate Autoenrollment from a non-Microsoft CA

the Microsoft CA is popular for issuing certificates for S/MIME, IPsec, VPN, SSL, 802.1x etc. and it helps to reduce PKI operational costs through autoenrollment.

On the other hand it comes with two major disadvantages: The online CA is vulnerable for attacks and the issued certificates are not accepted outside of your company.

In our **webinar** you will learn more about the following topics:

- Autoenrollment in a Windows domain from a non-Microsoft CA
- Linking with a public CA for globally accepted certificates
- Issuing certificates for users, Windows-, network- and mobile devices
- Central key archival and recovery
- En- and decrypting e-mails also on your mobile device
- Integrating Mobile Device Management (MDM) systems
- The Secardeo Certificate Enrollment Proxy

Please take your time for this

on **29. July 2015** from **18:00** to **18:30 CET** – (16:00-16:30 UTC/GMT in **English**)

on **29. July 2015** from **9:00** to **9:30 CET** (in **German**)

Please send us a short registration e-mail with the subject **“PKI Webinar”** to: info@secardeo.com
