Press Release

Secardeo certPush v2 for the Distribution of User Certificates and Keys to Mobile Devices

No. [2/ 2015](#)

Ismaning, 10. August 2015 - Secardeo releases version 2 of its key recovery and distribution service certPush. With certPush, X.509 user certificates and private keys can be simply and securely distributed to all devices of a user in a protected PFX container. The user or S/MIME certificates may stem from an internal Windows CA or a public CA like SwissSign or QuoVadis. A user can for example then encrypt and decrypt his e-mails on his smartphone. certPush supports the recovery of single private keys and batch recoveries of private keys of multiple users. Secardeo certPush can either recover only the current certificate and private key of a user or the whole key history. certPush enables the automated distribution of user keys to all mobile devices in an enterprise running iOS, Android or Windows Phone. By this, key distribution is done with a higher degree of automation and security than with popular Mobile Device Management systems.

Main features of certPush are:

- Recovery of keys archived in Secardeo certEP v4 or a Windows CA by Key Recovery Agents
- Secure distribution of private keys to other clients (i.e. mobile devices) via e-mail
- Automatic key distribution based on a list of e-mail addresses or account names
- Periodic background distribution (certPush service)
